

Transfer between natural cgreGFP and artificial peaks

Natural = the original cgreGFP landscape (including mutants). Artificial = the four approved peaks pooled.

Every fit: 14,709 training + 4,903 validation sequences (3:1); validation comes only from training sources.

Test: natural 4,904 or artificial 5,382 sequences — fixed 20% of each target landscape.

Used train/validation/test ratio: 60/20/20 for natural targets; 58.8/19.6/21.5 for artificial targets (rounding).

Artificial training/validation is proportional across peaks. Per-peak scores accompany these pooled scores.

Bars: mean of 3 runs; points: runs; error bars: SD. Artificial $\rightarrow$ Artificial tests variants within represented peaks, not an unseen peak.
