

Training size and natural/artificial cgre transfer

10 paired source/target folds; mean $\pm$ fold SD. Each fit uses n training + 4,413 source-validation sequences.

Test: natural 2,451–2,452 or artificial 2,690–2,691 (10% of target data per fold). Exact used ratios are in per_fold_scores.csv.

Artificial = four peaks pooled, with proportional sampling; all peaks represented in each fold. All models use native OHE.
